GSLS attenuation: matched lossless control

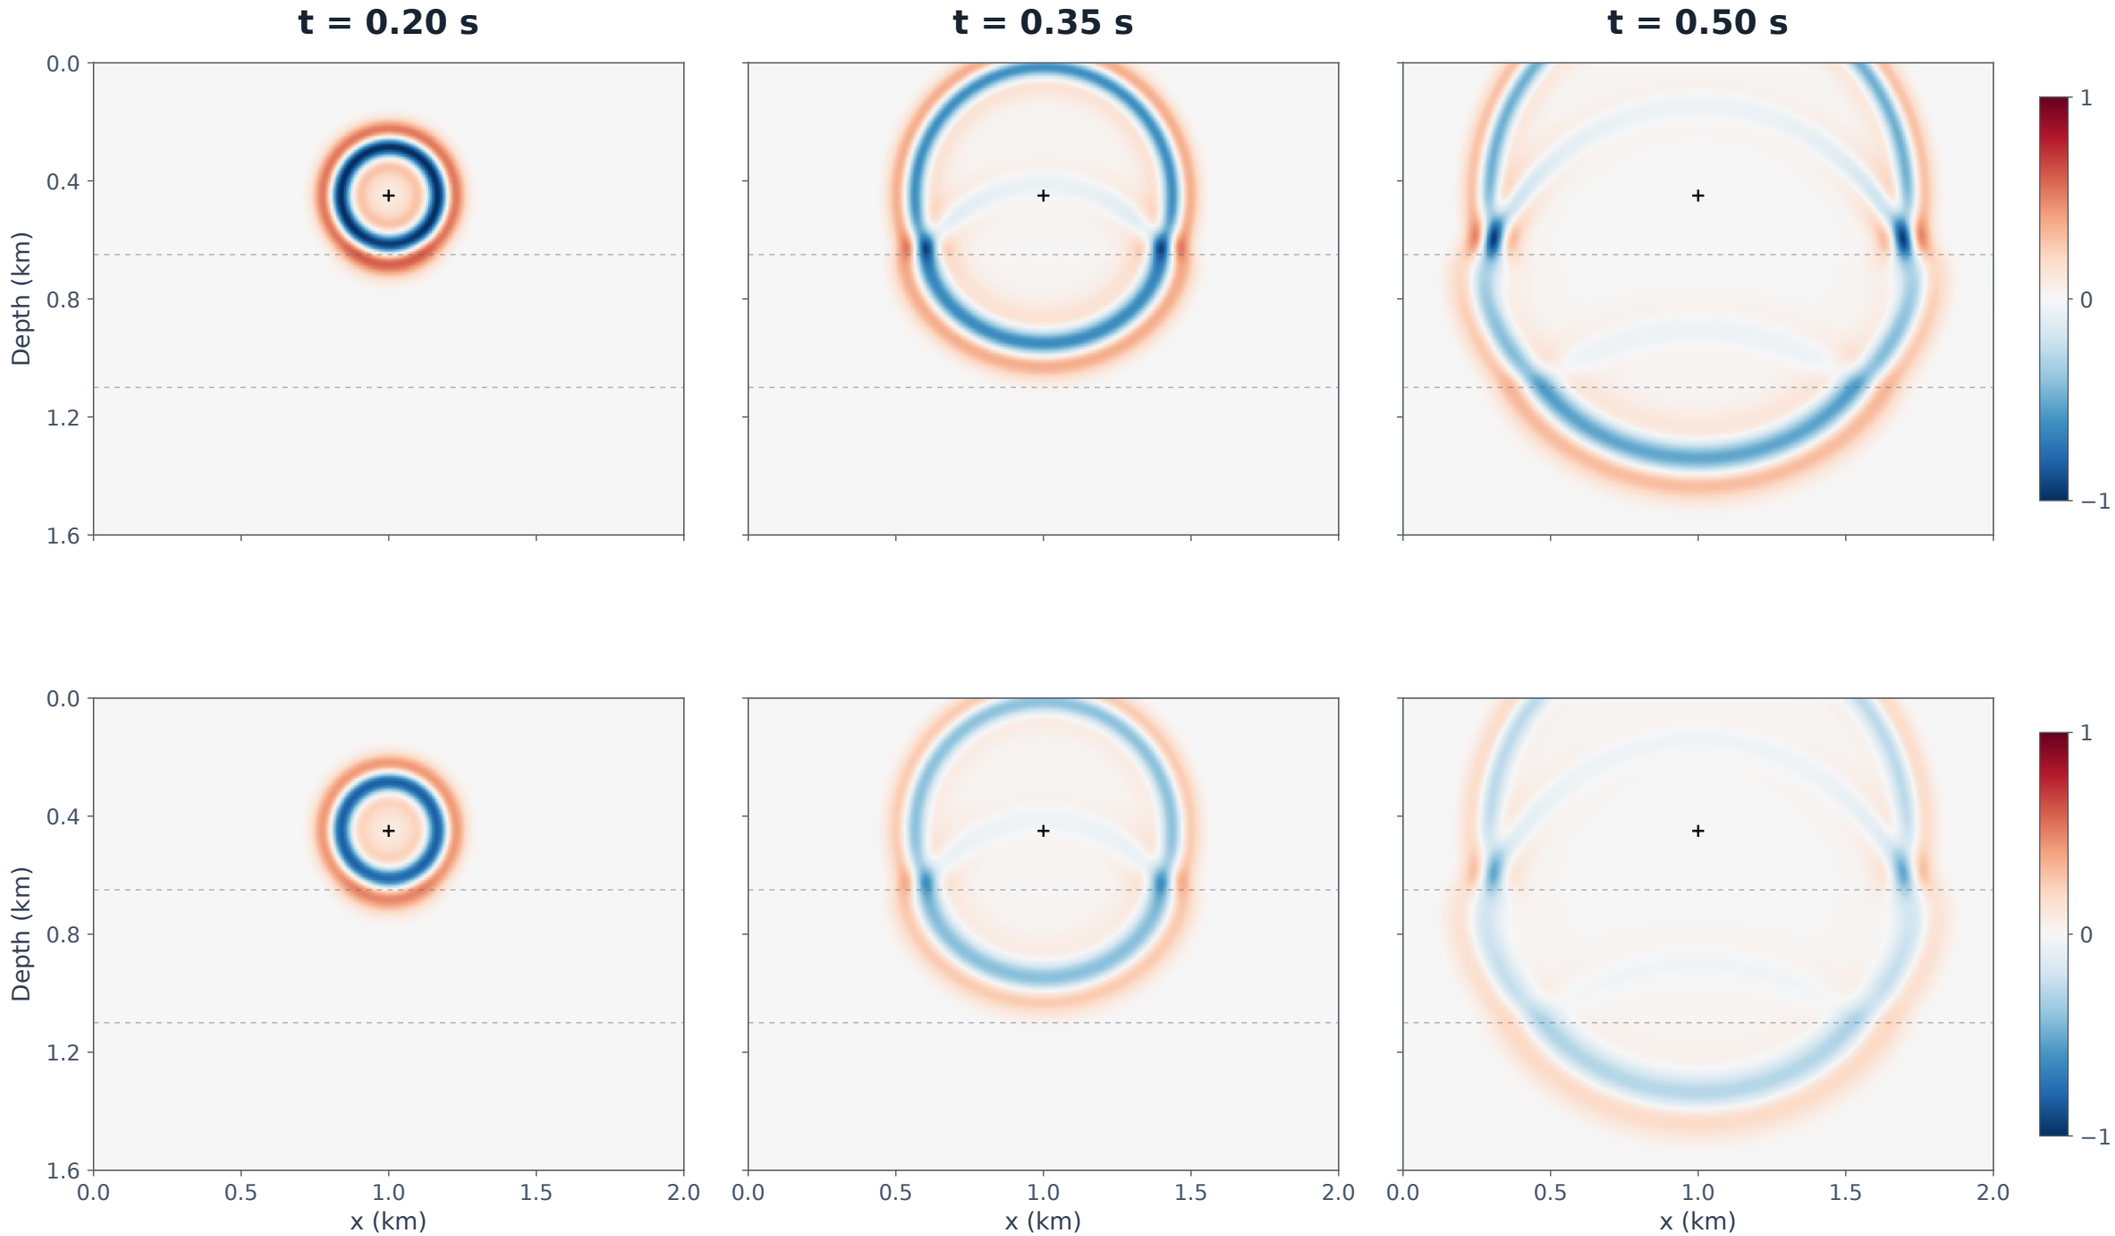

Same solver, source, vP and density. One shared linear scale: A = 1.85 Pa.

Lossless

$Q_0 = \infty$

Attenuating

Nominal $Q_0 = 30$

At t = 0.50 s: max |p| ratio = 0.543; grid L2-amplitude ratio = 0.597 (attenuating / lossless).

Ratios summarize these full-grid snapshots, including boundary effects; they are not physical-energy ratios or an accuracy test.

Color = p / A, shared across both rows and all times. No clipping. Dashed lines: layer interfaces. +: source.
